

A CONNECTOR

Abstract of the Disclosure

A connector for connecting a contact pad of a flexible printed circuit board against terminals of an electronic component comprises a body and a reinforcing plate, wherein the body is combined with the electronic component and two parallel sliding channels are mounted on the body corresponding to two sides of the terminals of the electronic component, and the reinforcing plate is combined with the contact pad of the flexible printed circuit board so as to increase the stiffness of the contact pad, and two sides of the reinforcing plate cooperate with the two parallel sliding channels of the body, thereby connecting the contact pad of the flexible printed circuit board against the terminals of the electronic component.
